

ASSOCIATION BETWEEN FRIDGE OPENING FREQUENCY AND PROBABILITY OF FINDING SOMETHING NEW INSIDE

IVANA SNACKWELL AND TUPPER WARE

ABSTRACT. Background: repeated refrigerator-door-opening behavior (“fridge-checking”) is common, but its relationship to the subjective probability of discovering something new inside remains uncharacterized. Methods: we conducted a 30-day prospective observational study of 42 households, logging daily fridge-opening frequency and self-reported discovery of novel contents. Results: discovery probability increased steadily with opening frequency, despite grocery deliveries being held constant across groups. Conclusion: these findings are consistent with an intermittent- reinforcement account of fridge-checking behavior, in which occasional genuine discoveries maintain a high rate of unrewarded checking.

1. INTRODUCTION

Refrigerators are widely believed to be static containers whose contents change only through the deliberate actions of their owners. This assumption has rarely been tested directly. In this study, we investigate whether the frequency with which a refrigerator door is opened — a behavior we term fridge-checking — is associated with the subjective probability that its owner reports finding something new inside, independent of whether anything was actually added to the refrigerator during the observation period.

We define fridge-checking, following the terminology introduced by [1], as any refrigerator-door-opening event that is not immediately followed by either the removal or the addition of a food item.

We re-read this definition after the change above and confirm it still matches how fridge-checking events were actually coded during data collection.

This comment from the first reviewer required a correction in two places in the manuscript — this sentence, in the introduction, and a matching one in the conclusion — applies equally to both instances.

Anecdotally, household members report opening the refrigerator repeatedly over short periods despite reporting no expectation that its contents have changed. We refer to this informally as the “hope springs eternal” hypothesis, a fridge-specific corollary of general optimism bias. This preliminary report builds on our earlier observational work [2] by formally quantifying the relationship between opening frequency and discovery probability across a larger and more diverse sample of households.

Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magnam aliquam quaerat voluptatem. Ut enim aequaleamus animo, cum corpore dolemus, fieri tamen permagna accessio potest, si aliquod aeternum et infinitum impendere malum nobis opinemur. Quod idem licet transferre in voluptatem, ut postea variari voluptas distinguere possit, augeri amplificarique non possit. At etiam Athenis, ut e patre audiebam facete et urbane

Stoicos irridente, statua est in quo a nobis philosophia defensa et collaudata est, cum id, quod maxime placeat, facere possimus, omnis.

2. METHODS

2.1. Study population and design.

We recruited 42 households across three cities to participate in a 30-day prospective observational study. Eligible households were required to own at least one refrigerator, have at least one adult member willing to complete a daily fridge-opening log, and report no professional catering experience, to exclude expert fridge-checkers, who were assumed to behave differently.

Households were recruited via flyers posted in laundromats, grocery stores, and one particularly well-trafficked gym.

Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magnam aliquam quaerat voluptatem. Ut enim aequaleam animo, cum corpore dolemus, fieri tamen permagna accessio potest, si aliquod aeternum et infinitum impendere malum nobis opinemur. Quod idem licet transferre in voluptatem, ut postea variari voluptas distinguere possit, augeri amplificarique non possit. At.

As shown in Table 1, households in the high-opening tertile reported markedly more fridge magnets and a higher prevalence of after-hours snacking.

2.2. Statistical analysis (updated).

The association between opening frequency and discovery probability was assessed using generalized estimating equations with an exchangeable working correlation structure [3], to account for the repeated, within-household structure of the daily opening logs.

The primary model

$$\text{logit}(P(\text{discovery})) = \beta_0 + \beta_1 \cdot \text{openings} + u_{\text{household}} \quad (1)$$

, where $u_{\text{household}}$ is a household-level random effect absorbing unmeasured, time-invariant fridge-checking tendencies.

While implementing the change above, we also noted that the estimated household-level random effect variance, $\hat{\sigma}_u^2 = 0.42$, is worth reporting explicitly: it

	Low tertile	Medium tertile	High tertile
Household size, mean	1.8	2.4	3.1
Owens a pet, %	12	19	31
Fridge magnets, median	3	5	9
Snacks after 10pm, %	21	38	64

TABLE 1. Household characteristics by tertile of daily fridge-opening frequency.

indicates non-trivial between-household heterogeneity in fridge-checking tendencies beyond what opening frequency alone explains.

Quod idem licet transferre in voluptatem, ut.

Theorem 2.2.1. *For any household refrigerator observed for a sufficiently long time, there exists at least one food item whose provenance cannot be established by any current member of the household.*

We propose to call this the Second Law of Fridge Thermodynamics.

Proof. Suppose, for contradiction, that every item in the refrigerator has a known provenance at every point in time. Then no item could ever transition from “recently purchased” to “mystery item” without an intervening act of forgetting. But forgetting is, empirically, unavoidable over a sufficiently long observation window [2]. This contradicts the assumption, and the claim follows. $\square$

3. RESULTS

Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magnam aliquam quaerat voluptatem. Ut enim aequi doleamus animo, cum corpore dolemus, fieri tamen permagna accessio potest, si aliquod aeternum et infinitum impendere malum nobis opinemur. Quod idem licet transferre in voluptatem, ut postea variari voluptas distinguere possit, augeri amplificarique non possit. At.

Figure 1 shows an apparent dose-response relationship between opening frequency and discovery probability, despite grocery deliveries being held constant across groups by design.

Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magnam aliquam quaerat voluptatem. Ut enim aequi doleamus animo, cum corpore dolemus, fieri tamen permagna accessio potest, si aliquod aeternum et infinitum impendere malum nobis opinemur. Quod idem licet transferre in voluptatem, ut postea variari voluptas distinguere possit, augeri amplificarique non possit. At etiam Athenis, ut e patre audiebam facete et urbane Stoicos.

A sensitivity analysis was conducted to assess robustness to unmeasured hunger confounding, following [4].

Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magnam aliquam quaerat voluptatem. Ut enim aequaleam animo, cum corpore dolemus, fieri tamen permagna accessio potest, si aliquod aeternum et infinitum impendere malum nobis opinemur. Quod idem licet transferre in voluptatem, ut postea variari voluptas distinguere possit, augeri amplificarique non possit. At etiam Athenis, ut e patre audiebam facete et urbane Stoicos irridente, statua est in quo a nobis philosophia defensa et collaudata est, cum id, quod maxime placeat, facere possimus, omnis voluptas assumenda est, omnis dolor repellendus. Temporibus autem quibusdam et.

4. DISCUSSION

Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magnam aliquam quaerat voluptatem. Ut enim aequaleam animo, cum corpore dolemus, fieri tamen permagna accessio potest, si aliquod aeternum et infinitum impendere malum nobis opinemur. Quod idem licet transferre in voluptatem, ut postea variari voluptas distinguere possit, augeri amplificarique non possit. At etiam Athenis, ut e patre audiebam facete et urbane Stoicos irridente, statua est in quo a nobis philosophia defensa et.

These results are consistent with an association between fridge-checking behavior and perceived discovery probability, though the observational design and the

absence of a formal blinding procedure for refrigerator contents limit causal interpretation.

Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magnam aliquam quaerat voluptatem. Ut enim aequaleam animo, cum corpore dolemus, fieri tamen permagna accessio potest, si aliquod aeternum et infinitum impendere malum nobis opinemur. Quod idem licet transferre in voluptatem, ut postea variari voluptas distinguere possit, augeri amplificarique non possit. At etiam Athenis, ut e patre audiebam facete et urbane Stoicos irridente, statua est in quo a nobis philosophia defensa et collaudata est, cum id, quod maxime placeat, facere possimus, omnis.

5. CONCLUSION

Taken together, these findings suggest that the refrigerator door itself may function as an intermittent-reinforcement device, rewarding repeated checking with an occasional, genuinely novel discovery.

As already noted in the introduction, this conclusion applies equally to the paired instance of the same reviewer comment discussed there.
